Preemie Parent Alliance to Focus on Importance Of Exclusive Human Milk Diet at its 2017 Annual Summit

FORT WORTH, TX, Sept. 29, 2017 – A panel of leading experts will examine the clinical benefits and access challenges of human milk as the standard of care for premature infants born weighing less than 1,250g (2 lbs 12 oz) at the Preemie Parent Alliance (PPA) 2017 Annual Summit, Sept. 29 through Oct. 1, 2017, in Fort Worth, TX.

The PPA Annual Summit provides a collaborative platform for parent organizations, healthcare professionals and care providers to identify and address the urgent needs of parents who have an infant in the neonatal intensive care unit (NICU). The Summit also brings leaders together from NICU parent support organizations across the country, and this year, one from Brazil.

The panel discussing the benefits of an exclusive human milk diet (EHMD)¹ for premature infants will feature Scott Elster, President and CEO of Prolacta Bioscience®, the pioneer in human milk-based neonatal nutritional products for premature infants, as well as Melinda J. Elliott, M.D., Senior Director, Clinical Education and Professional Development at Prolacta, and Erin Hamilton-Spence, M.D., Neonatologist and Past President of the Mothers’ Milk Bank of North Texas. Lisa Grubbs, PPA Leadership Team Member and founder of NICU Helping Hands, will facilitate the discussion, which will be held on Sept. 30 at 11 a.m. in the Hochberger Auditorium of Cook Children’s Medical Center.

The panel will explore the following topics:

- The benefits, costs and challenges of human donor milk and human milk-based fortifier.
- How PPA member organizations can effectively educate the families they serve and advocate on behalf of these families, to ensure critically ill infants receive optimal nutrition.

PPA Founder and President Keira Sorrells said, “Prolacta fully understands, respects and embraces the importance of educating and empowering parents, caregivers and parent support organizations to ensure the best nutrition for fragile babies. Our mutual commitment to meeting the unique needs of babies in the NICU makes a remarkable difference for these infants and their families.”

When used as part of an EHMD, Prolacta’s neonatal nutritional products are clinically proven to improve health outcomes²⁻⁴ and reduce hospital costs⁵⁻⁶ for critically ill, extremely premature infants weighing between 500-1,250g (1 lb 1oz to 2 lbs 12 oz) at birth, in the NICU, as compared to cow milk-based fortifier or cow milk-based preterm formula.

-more-
PPA is the nation’s leading network of parent organizations offering support to families of premature infants through education, public policy, healthcare guidelines, advocacy and direct family support.

About Prolacta Bioscience
Prolacta Bioscience, Inc. is a privately-held life sciences company dedicated to Advancing the Science of Human Milk®. The company pioneered the development of human milk-based neonatal nutritional products to meet the needs of critically ill, premature infants in the NICU. Prolacta leads the industry in the quality and safety of nutritional products made from donor breast milk and operates the first and only pharmaceutical-grade manufacturing facility for the processing of human breast milk.

1 An EHMD is when 100% of the protein, fat and carbohydrates in an infant’s intake are derived solely from human milk.
4 Abrams SA, et al. Greater Mortality and Morbidity in Extremely Preterm Infants Fed a Diet Containing Cow Milk Protein Products. Breastfeeding Medicine. June 2014. 9(6): 281-0285. doi:10.1089/bfm.2014.0024. This cohort study included 260 extremely preterm infants born weighing less than 1,250g who received a diet that ranged from 100% cow milk to 100% human milk.
6 Assad M, et al. Decreased Cost and Improved Feeding Tolerance in VLBW Infants Fed an Exclusive Human Milk Diet. Journal of Perinatology. March 2016. 36:216-220. doi: 10.1038/jp.2015.168. The study retrospectively looked at 293 preterm infants between gestational ages of 23 to 34 weeks and birth weights between 490-1,700g in the Level III NICU. The study compared the clinical and financial impacts between infants that were fed an exclusive human milk diet; cow milk-based fortifier and maternal milk; mixed combination of maternal milk, cow milk-based fortifier and cow milk-based formula; and formula between March 2009 and March 2014.
