What is an exclusive human milk diet?

EHMD

An EHMD is achieved when 100% of protein, fat, and carbohydrate are derived from human milk. This diet includes a human milk–based human milk fortifier.

An EHMD for very low birth weight babies supports adequate growth,¹ can contribute to increased survival rates,² and can decrease costly complications associated with the intake of cow milk–based products.^{3,4,*}

*For babies weighing ≤1250 g. Outcome measures were statistically based on mean weight data.

All Neonatal Nutritional Products From Prolacta Are 100% Human Milk-Based

Prolacta is committed to helping healthcare providers meet the nutritional needs of extremely premature infants in the neonatal intensive care unit (NICU). In an effort to support clinical decision-making for an exclusive human milk diet (EHMD), we are providing detailed information on the nutrients in our full line of 100% human milk-based neonatal nutritional products.

When mixed with mother's own milk (MOM) or donor human milk, Prolacta's human milk-based human milk fortifiers provide nutrition that falls within the recommendations established by the American Academy of Pediatrics (AAP).¹ The products contain protein, fat, and carbohydrate derived from pasteurized donated human milk, with essential minerals added.[‡]

Prolact HM® human milk (human, pasteurized) and PremieLact® human milk for trophic feeds (pasteurized) are standardized and can be used when MOM is unavailable. They contain protein, fat, and carbohydrate, with no minerals added.

Prolact CR® human milk caloric fortifier (human, pasteurized) is pasteurized human milk cream with no minerals added.

Prolact RTF human milk-based premature infant formula is standardized to ensure predictable delivery of nutrients. The product contains protein, fat, and carbohydrate derived from pasteurized donated human milk, with essential minerals added.[‡]

Although we can provide the nutritional information for our products, we recognize that there is no single source of information that establishes nutritional values for human milk. Thus, to help with the preparation of a feeding solution with Prolacta's fortifiers, we have provided these nutritional references for preterm milk and term milk:

- Preterm milk values are adapted from *Nutritional Care of Preterm Infants: Scientific Basis and Practical Guidelines*.²
- Term milk values are adapted from the AAP handbook entitled *Pediatric Nutrition*.¹

We do not add vitamins, iron, manganese, iodine, or selenium to any of our products. Vitamins in human milk vary naturally, and the amounts present in Prolacta's products are further affected by manufacturing processes. The amounts of fat, protein, carbohydrate, and minerals (except for iodine and selenium) are based on median values derived from multiple

lots, while the concentrations of vitamins,[†] iodine, and selenium are based on values derived from an individual lot or a composite of multiple lots.

An EHMD requires nutritional supplementation. Any required additional vitamins and iron must be administered separately from Prolacta's products.

The values presented in this brochure are for reference only. Regular nutrition monitoring is required, and appropriate medical judgment should always be exercised when using feeding guidelines. For more information about Prolacta's products and providing an EHMD, please contact your Prolacta representative.

[‡]Sodium, potassium, chloride, calcium, phosphorus, magnesium, copper, and zinc.

[†]Vitamin A, vitamin D, vitamin E, vitamin K, biotin, thiamine, riboflavin, vitamin B6, vitamin B12, niacin, folate, pantothenic acid, and vitamin C.

Prolact+4® (20 mL) Nutrition Information

When Mixed With Preterm Human Milk

The nutrient values below are provided for general reference only. They are based on median values derived from multiple lots or values derived from a composite of multiple lots for the fortifier and the published reference regarding preterm human milk.[§] The values are standardized.

Prolact+4 fortifier is available in a lower-volume 10 mL solution. When mixed, the lower volume of fortifier is half the volume but provides the same amount of nutrients per 100 mL of fortified milk.
